

The wiki page: "Recipe Finder API" (generated by Claude AI)

We built an API for the recipe app. Developers can use it to search recipes and get details about them. The endpoint is /recipes.

You need an API key. Put it in the header. The key is how we know who you are.

Optional parameters:

- Cuisine: like "italian" or "mexican" or "japanese". Not case sensitive. Optional.
- Diet: "vegetarian", "vegan", "glutenfree". No spaces in glutenfree. Optional.
- maxTime: this is in minutes. How long the recipe takes. Optional.
- Servings: how many people it feeds, default is whatever the recipe says. Optional.

The response has a list of recipes. Each recipe has a name, ingredients list, and instructions. There's also a nutrition object but it's only there sometimes depending on the recipe. The ingredients are a list of strings. Instructions are a numbered list. There's also a field called "prepTime" and one called "cookTime" and one called "totalTime" but totalTime isn't always the sum of the other two because some recipes have a rest time or marinating time that gets counted.

You can also get a specific recipe by id if you know it. The endpoint for that is different, it's /recipes/{recipeId}.

If something goes wrong you get an error. Could be a 400 if the request is bad. Could be a 404 if the recipe doesn't exist. Could be other stuff too.

There's a limit on how many requests you can make. It resets every hour. We haven't decided the exact number yet so don't document that part.

Results from the /recipes search come back sorted by relevance but you can change it to sort by time (shortest first) if you want.

The ingredients list uses the units the recipe was submitted in so it could be metric or imperial, we don't normalize it. There's no way to request a specific unit system for ingredients.

Sample for /recipes search:

```
{
  "results": [
    {
      "id": 982,
      "name": "Spaghetti Carbonara",
      "prepTime": 10,
      "cookTime": 20,
```

```

    "totalTime": 30,
    "servings": 4,
    "cuisine": "italian",
    "diet": [],
    "nutrition": {
      "calories": 620,
      "protein": "28g",
      "fat": "22g"
    }
  },
  "total": 1,
  "page": 1
}

```

Results are paginated. Default page size is 10. You can pass a page parameter to get other pages.

Sample for /recipes/{recipeId}:

```

{
  "id": 982,
  "name": "Spaghetti Carbonara",
  "prepTime": 10,
  "cookTime": 20,
  "totalTime": 30,
  "servings": 4,
  "cuisine": "italian",
  "diet": [],
  "ingredients": [
    "200g spaghetti",
    "100g pancetta",
    "2 large eggs",
    "50g pecorino cheese",
    "black pepper to taste"
  ],
  "instructions": [
    "Boil the spaghetti until al dente.",
    "Fry the pancetta until crispy.",
    "Mix eggs and cheese in a bowl.",
    "Combine all ingredients off the heat."
  ],
  "nutrition": {
    "calories": 620,
    "protein": "28g",

```

```
    "fat": "22g"  
  }  
}
```
